

The RCED Model, Explained Simply

Another way to organize the economy

In one sentence:

The RCED proposes that the wealth created by machines and labor benefits everyone: we work less, live better, and pollute less thanks to cooperative enterprises (owned by those who work and shop there) and a public fund controlled by citizens.

The Starting Idea

Today, when a machine replaces a task, it is often the person who loses their job.

The RCED reverses this logic: the time and money saved thanks to machines are shared among all, instead of enriching a few.

Popularization of Nadir Felder's model v4.3.2. June 2026

The 6 Ideas, Simply

1. Nothing is hidden

All wealth becomes visible in a large, secure digital registry. It is no longer possible to hide money abroad to avoid taxes.

Like... a large public ledger that no one can rig.

2. A piggy bank that belongs to everyone

A portion of taxes feeds into a 'citizen fund.' This shared savings invests in the real economy: housing, energy, hospitals, trains.

Like... a national savings account of which every resident would be a co-owner.

3. Democratic enterprises

Cooperatives belong to their workers and their customers; major decisions are voted upon. This is not a utopia: Switzerland already has very large ones, like Migros, Coop, or Mobilière, which already exist and operate this way.

4. The machines work, you take a breath

When technology makes work more efficient, the gain is split four ways: fewer working hours, shared savings, training, and the fight against pollution.

Like... sharing a bigger cake instead of keeping it for a few.

5. Automate tasks, strengthen humans

Repetitive tasks are entrusted to machines. People freed up this way are trained for free (with real degrees) for professions where humans are irreplaceable: healthcare, education, ecology.

Like... moving hands to where they truly matter—at people's bedsides, not on the assembly line.

6. Trains, energy, and internet for everyone

These networks become shared common goods, not private toll gates. And a 'pollution budget' decreases every year to reach net zero emissions in 2050.

Like... roads: everyone uses them, nobody owns them to collect rent.

What Would It Change for You?

Concretely, in everyday life:

- ✓ You would work about 28 hours per week, without earning less.
- ✓ More healthcare workers and teachers: fewer patients per caregiver, smaller class sizes.
- ✓ Smaller gap between the richest and poorest.
- ✓ Cleaner air and a preserved climate.
- ✓ Nobody unemployed because of machines: people are trained and paid for another useful profession.

The Promised Figures (over 20 years)

In the model's reference scenario:

- **28h** per week (instead of 41h)
- **0.185** coefficient of inequality (against 0.320 today)
- **+175%** of wealth produced
- **1.49 M** people retrained for human jobs
- **-68%** pollution (net zero in 2050)
- **100%** of gains shared, nothing created from nothing

Let's Be Honest

- It is a proposal, not a law or an already realized experiment.
- The figures come from a simulation: they show what would be possible if everything went as planned—they are not certainties.
- It would require votes and trials in one or two cantons before any actual deployment.
